

## Assignment 4

For the Ship D in A given load condition corresponding to the following condition:

Lpp.....87,3 m

$\Delta$ .....5870 tons

LCG..... 43,2 m

Further details given in appendix 1

**4.1** Calculate the draft fore and aft.

In order to trim the vessel, 130 ton of ballast water is filled to the fore peak tank located at a LCG of 85,66 m.

**4.2** Calculate the new draft fore and aft.

**4.3** Calculate the Trim of the Vessel

.....

At departure the ship has a displacement of 6000 tons and has two full fuel oil tanks side by side, located in the double bottom. (one tank SB and one tank PS )

The metacentric height corrected for free surface effect, has been found to:  $GM_c = 4,50 \text{ m}$

Each tank has the following measurements 18 m long, 8 m wide, and 2,2 m deep.

The density of the fuel oil:  $947 \text{ kg/m}^3$

Somewhere on the voyage, half of the fuel has been used, equally form both tanks.

**4.4** Calculate the reduction of the  $GM_t$  and the new  $GM_c$ , from the two 50% filled tanks.

**4.5** Explain the influence of dividing the fueltanks in two, with a mid-mount center bulkhead (slingerskot), instead of just having one big tank in the full with of the Vessel.

## Appendix 1
